An atom is a building block of matter that cannot be broken apart using any chemical means. Nuclear reactions can alter atoms. The three parts of the atom are protons (positively charged), neutrons (neutral charge), and electrons (negatively charged). Protons and neutrons form the atomic nucleus.

Basic Model of the Atom - Atomic Theory

An atom is the smallest unit of ordinary matter that forms a chemical element.Every solid, liquid, gas, and plasma is composed of neutral or ionized atoms. Atoms are extremely small, typically around 100 picometers across. They are so small that accurately predicting their behavior using classical physics—as if they were tennis balls, for example—is not possible due to quantum effects.
